Focus

What To Do Next?

Focus is a centralized task manager that provides one definitive answer to the question: what to do?

Focus is an intelligent task orchestration system built for overwhelmed teams and organizations for modern teams overwhelmed by dependencies, fragmented tools, and shifting priorities. Focus provides users' team members with just one task at a time, ensuring maximum focus and zero wasted mental energy.

Modern project and task software are great at storing and visualizing tasks, lists, and dependencies; but none of them solve the real problem: knowing what you and your teams should actually work on next.

Focus isn't another dashboard or board view. It not only maintains a live dependency graph linking tasks, deadlines, blockers, but it also automatically rebalances tasks based on people and teams' capacities, skills, and workloads as well as a business' current priorities to maximize organizational flow.

"We realized that the hardest decisions for employees to make aren't which approach to take, they are what to do," said the Lead Architect of Focus. "We built this system to be the brain of your workflow, streamlining everything into one task to do next."

Using Focus is seamless. Teams define organizational priorities and project structures and then submit and edit tasks, which are linked into a dynamic dependency graph. As tasks are added or updated or if priorities change, Focus's engine updates everyone's queues. When a user is ready for new work, they simply ask: what to do next? Focus then evaluates the global system state and returns the highest-impact task to that user. The user then accepts the task and starts to work on it. This eliminates priority drift, prevents minor tasks from crowding out mission-critical work, and turns scattered inputs into a single execution queue for every contributor and team.

"Before using Focus, we spent hours coordinating who should do what. Now, we just ask Focus to make the decision in real time." – *John Smith, Senior Project Manager.*

Humans are really monotaskers. Research shows that we can only really focus on one task at a time. Focus ensures that that task is the correct one to be focusing on at that moment.

FAQ

Customer FAQs

Q: Can I add tasks from multiple devices? Yes.

Q: What happens if priorities change? If priorities change, simply update your priorities before accepting your next task. The next task you request will be the most highly prioritized task according to the updated priorities.

Q: Can tasks be reassigned automatically? Yes. Focus continuously evaluates deadlines, blockers, capacities, skills, and workloads. It can either recommend reassignments or apply them autonomously based on governance rules.

Q: Can I undo my acceptance after starting a task? Yes and No. You can not return a task to Focus once it has been accepted. You may, however, easily submit an identical task by copy-pasting from your currently accepted tasks' characteristics.

Internal FAQs

Q: Why focus on serving only one task at a time? Research shows that long lists contribute to cognitive load and choice paralysis. Humans do their best work when presented with one next action, not many options. Tools today show what exists. Focus dictates what to do next.
